

The **Archetype** Edge Pull was designed for Fleetwood sliding door series.

### Proprietary Design

The Archetype Edge Pull was designed and engineered exclusively for Fleetwood products and is not available elsewhere on the market.

### Stainless Steel Components

The Archetype Edge Pull is crafted from cast 316 stainless steel. Type 316 is a marine-grade stainless steel that is resistant to reactions such as corrosion and maintains its strength at elevated temperatures. The handle and casing were thoughtfully shaped for minimal presentation and lifetime endurance.

### Linear Design & Smooth Operation

The Archetype Edge Pull was carefully engineered with cast stainless steel components in a linear, sleek design. Each component was custom formed to create a smooth pull actuation.

### Extraordinary Process

The exposed surfaces of the pull are finished with a unique process called Electropolishing for a [Lifetime Warranty](#) in coastal applications. It is an electrochemical process that removes material from a metallic surface, reducing the roughness by levelling micro-peaks and valleys, while also improving the finish.

### Brushed Finish

The Archetype Edge Pull is offered in a brushed stainless steel texture (fine bristle sanding that leaves a non-reflective surface).
